

Syarah App

Technology used:

- **Back-end:**
 - C#, Asp.net v4.6.1 (not Asp.net Core), Abp.
- **Database:**
 - SqlServer, EntityFramework.
- **Front-end:**
 - The application follows a **hybrid architecture** where AngularJS (version 1.x) is embedded within ASP.NET MVC views.
 - This is not a full-fledged Angular Single Page Application (SPA) as it relies on **server-side rendering (SSR)** using Razor, with AngularJS providing client-side enhancements.
 - HTML, CSS, JavaScript, **Hybrid system using AngularJS** with ASP.NET MVC.

Implementation Evaluation:

This project has **not been executed correctly**, leading to **various challenges affecting the realization of the intended business idea**. Performance, user experience, and scalability could be improved by **adopting a modern architecture that separates the frontend and backend**, such as transitioning to a

newer Angular framework with an API-driven approach for better integration.
